The bright planet ♀ is a morning Star from the 8 of September in the last year, to the 28 of June this year, at which time it is full moon (The ☉ and ♀ being in conjunction in the watery signe ♋) about midnight. From which time to the 19 of Aprill 1646 she is a bright Evening star. And then she by retrogradation meetes the Sun and ☿ in her dominions in the first face of ♋, The moon being at full again in her fall in opposition to them; but from thence to the 6 of February 1647 shee is a bright morning starre againe.

An abstract of the tide-table with the age of the new moon

the ho & min of full sea at London Bridge, &c. every day this year. 1645

The age in.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
of the M ^o de.	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30

The use of the Table followeth: First know the day of the Moneth which you shall seek for on the other side; gover against that day of the month in the column for the month you shall have the age of the moon, with which age of the moon, if you enter the small table above you shall know the hour and minutes of full sea (or high water) at London bridge, &c. Example. The first day of *Jan*. I finde 13 which is the age of the moon increasing (joyned with 28 the age of the moon decreasing, which is on the 16 of *Jan*. upon both which dayes, it is high water at the same hour, or very neare) Under that 13 the age of the moon for the first of *Jan*. or 28 for the 16 of *Jan*. I finde 1. 24. which shewes that at 1 a clock & 24 min it is high water at London bridge &c. That is to say in the morning or after noon, for you must know that every 12 houres it is high water at London bridge &c. And yet note that every Tide alters 24 min. of time so that the afternoon Tide is 24 min. later then the morning Tide. If you doe thus with any other the places mentioned in the Table general, you may have a particular table speedily for any place, and finde it so easy, that unless you have *Mamus sub pallis*, or plead ignorance you will need no further directions.

But with all you must observe that it floweth one point of the Compass more in the Spring tides, that is, at the new and full moones, then it doth at the Neape tides, that is, at the first and last quarter of the moon, especially if it be a River where there is any indraught, and of good distance from the sea; yea when there is neither rage of winds, Land-floods, nor other cause to produce or hinder the said effect. As for example. It is full Sea or high water at London bridge at the new or full moon when the is S.VV. or N.E. But in the quarters of the moon, it scarcely floweth there when the moon is S.VV. by S. or N.E. by N. And by reason of the many Arches that London-Bridge standeth on, it floweth holwers and ebbs 7 causing the Tide to differ, or be sooner or slower then this table giveth in the full sea, though at most other places it is 6 ho flood, & 6 ho eb. So that by this you may perceive that the 1 of *Jan*. this year, &c. The Tide turns & flows westward about 7 in the morn. & at 24 min past 1 afternoon, it is high water at London bridge at which time it returns to the Sea againe, which is very necessary to be knowne by those whose occasions

Why stay'st thou *Mars* so long in *Gemini*?
Why do'st thou give thy self so much to wrāgle
It is, because of thy malignity!
Thou do'st so often vex the Southerne Angle,
Welll have heard, a curst Cow's horns are short
Thy range in *Cancer* will spoyle all thy sport.

Though Sol with *Cronas*, both with *hermes* meet
And though old *Saturn*, now doth *Venus* greet
It is but fained friendship; 'twill not last.
Mars wheelles about, & doth amongst the cast
A bone, I meane a most malignant beame,
Which will perplex the guilty; 'tis no dreame.

Saturn on Venus knits his brow and lowers,
Foretels Domestick discords; suddain showers,
He likewise cast's on glorious Sol a frowne
He jarrs with Hermes; thus Gods will is known
By his revealed works; Heaven's his greatbook
The Stars are letters, whereon man should look

A Prognostication. BOOKER. 1645.

A Discription of the severall parts of
the A L M A N A K for this Year

1645.

The first Column is the dayes of the moneth.

The Second is the dayes of the weeke & being Sunday
Letter, in the Julian or English Account.

The third is such Saintes dayes as are yet in use with us,
and instead of persons dayes I have placed the planets in such
a signe and degree as they happen on such a day of the moone
as they are noted on; together when they be Orientall, that is
when they may be seene before Sun rising, or Occidentall
when they may be seene after Sun set: As also the Con-
junction of the Moone with the planets; and the planets
among themselves, by which means they may be called
knowne &c.

The fourth is the Moones place & by the bright & both
called the signe & the figure and degree she is in every day
of the moone.

The fifth is the houre and minutes of Sun rising at London
by the whereof may be knowne the time of Sun set, the
length of the day and night throughout the year.

For if you double the houre and minutes of Sun rise you
will have the length of the night.

If you subtract the houre and minutes of Sun rise from
the houre, the remainder will be Sun set.

If you double the houre and minutes of Sun set you
will have the length of the day.

The day beginning at Sun rising and ending at Sun set
is called a Natural day; And the night beginning at Sun set
and ending at Sun rise is called a Natural night. But the day
and night natural is the space of 24 houre, and by a

the next following day, Hence it is that one a clock in the morning, or after midnight by them is called the thirteenth houre, two is called the fourteenth houre, and so forth to 24 houres.

Obserue that 60 minutes makes an houre, 45 minutes is three quarters of an houre, 40 minutes is two thirds parts of an houre 30 minutes is halfe an houre, 20 minutes is one thirds part of an houre, 15 minutes is a quarter of an houre, and 6 minutes is one tenth part of an houre: And obserue further,

So many minutes as the Sun riseth before, 4 5. 6. 7. 8. 9. } A Clock.
So many minutes he sett after 8 7. 6. 5. 4. 3 }

As for example the Sun riseth at London the first of January at 8 of the clock and 2 minutes, that is 58 minutes before 9 of the clock, therefore he sett 58 minutes past three of the clock. The rest is so easie, example is needlesse.

The Sixt Column is a probable conjecture of the weather and other Astrologicall observations, gathered from the configurations of the Stars and planets, together with the time when such aspects happen or are most in force this yeare observing that (a) stands for afternoon, (b) before noon, (c) morning, (d) for night in this Almanack, you shall likewise in that column, placed over against the day of the month on which it is new Moone, first quarter full Moone of last quarter. The signe and degree that is ascendant or riseth in the East at the very moment of such Lunation which you may see on the top of every month with the Lords of each Lunation.

On the other (or right hand) page is the Forraigne or Roman account, being ten dayes before Easter in that respect true then ours, To which is joined the true Account, being dayes certain houres and minutes before and true to the Roman (which with both them and would so be) and will so continue to the yeare 1734. If the world last so long. The reason of these differences is the change of the Equinoxes and Solstices which every yeare goe back ten minutes 48 seconds; so that in 124. yeares, the Equinoxes and Solstices do anticipate 14 houres, 6 minutes, 53 seconds, & that is to say, a whole day and somewhat more. And by this Calculation in 1645 yeares, there are 12 dayes, 11 houres, 3 minutes and 10 seconds gone back. But of this matter I have formerly spoken in my Almanacks of 1672, 1673, 1674, 1675, 1676, 1677, 1678, 1679, 1680, 1681, 1682, 1683, 1684, 1685, 1686, 1687, 1688, 1689, 1690, 1691, 1692, 1693, 1694, A Definition and Defence of Astrologie.

Astrologia est Doctrina, qua ostendit Vires stellarum, cognitæ per-
petua experientia, & qualitates, temperamenta, & inclinationes
in Elementis, & corporibus hominum, ortu a luce, & motu stellarum
quibus qualitatibus, temperamentis, & inclinationibus respondens sua
quodam ratione, nisi aut Divinitus, aut alijs Causis fortioribus im-
mediatur. O more briefly thus (as Sir Christopher Heydon
against Chambers, fol. 2.) Astrologie: an Art which teacheth
by the motions Configurations and Influences of the figures
Stars, and Celestiall Planets, to Diagnosticate of the natu-
rall effects and mutations to come in the Elements, and
these four and Elementary Bodies.

Ficke that learned but *Astrologie's* great adversary, Chambers his imi-
tator, The Author of *Astrologomantia* if they were alive, Nor T. P.
the Publisher thereof, nor any of their Coat, nor the greatest Ad-
versary this day living can deny this definition, nor answer Sr. C. M.
Defence of iudiciall *Astrologie*. If any have abused the Art, they
are old enough, let them answer for themselves. This Definition
contains not onely the Causes which concur to the constitution of
the Nature and Essence of *Astrologie*, but besides expresseth the end
or final cause whereto all the precepts of the Art are to be referred,
And it is divided into two parts, The one *Speculative, Theoreticall, or*
Astronomickall, which consisteth in the knowledge of the heavenly
motions, by which may be knowne the stars and planets, &c. The
other part without the which the first is of so much use, iust as the
simple *Botanologians* or *Herbarists*, who coming into a curious gar-
den, can perhaps give you the names of the severall herbs, flow-
ers and plants therein growing: But as this without further inspec-
tion into *Physiologie* cannot describe the vertues of his plants, No
more can the other the Influence of the planets) is the Practick (or
the too much abused) *Astrologickall* iudiciary part: For as the for-
mer being conversant about the subject of this Art, doth furnish the
Astrologian with matter wherein to exercise himself; So this other
disposeth this matter, and accordingly judgeth, as the case doth re-
quire: This Practick part likewise is subdivided into two parts, As
Polony lib. 2. Quod. scilicet, The first considereth the Generall State
of the world; and by Eclipses, Comets, great Conjunctions, Annall
Revolutions, quarterly Ingresses, and Lunations, and by the Rise-
ing, Culminating and Setting of the fixed Stars, together with the
Configurations of the Planets both to the Sun and amongst them-
selves, doth yearly judge of Sensitive and Vegetative things; whato-
ever, living in the Ayre, Water, or Earth, of Plagues, Plenty, Dearth
Mutations of the Ayre, Wars, Peace, and other like generall con-
ditions of whole Countries.

of every singular man. And now let me give my Countrey men advice (considering the excellent use and benefit a good Physitian, and one skillfull in *Astrologie* may make, in the preventing and cure of many diseases incident to mankind.) That they would diligently observe the Nativitie. That is to say, the day, houre and minute as neere as can be when any of their children are borne; For the most principall conjecture of the malignity and magnitude of any disease, whether it be curable, or shall end with death, depends upon the knowledge of the Nativitie if it may possibly be obtained; And there is scarce any disease happens to any one, but some *Unfortunate direction of the Luminaries*, or of the *Ascendant* to the body or beames of the *Malignant Planets*, preceded the same, or some evil *Revolution*, *Profection*, or *Transit*, which in no wise can be knowne but by *Astrologie*. *Es nulla fides adhibenda medico nisi ostia Astrologiae*. Besides it were to be wished that the true time of Decumbiture or falling sick of any, were precisely observed; And that together with the Nativitie compared, the Physitian shall reap more credit by his *Astrological Observations*, then by all his other skill. Nay, the *Astrologer*, for aught, shall often controul the Physitian; For when the *Astrologer* foretelles a *Phlegmatick* man, that he shall fall at such a time into a *Cholericke* disease, the Physitian will perceive by his *Physicall signes*, that the *Astrologer* out of more secret causes, in nature, hath gone beyond him and his Art. *Astrologie* is more certain then *Physick*; For it reasoneth from the Cause to the Effect, so doth not *Physick*. Now if the Divine Will do not countercheck the ordinary course of Nature, or the matter of the *Elementary Bodies* here beneath, be not unproportionable, and thereby unapt to receive their impressions; there is no reason why in a naturall and *Physicall* necessity *Astrological* predictions made according to Art, should not succeed and take effect; and by how much the knowledge which we have by the known Causes, is more demonstrative and infallible, then the which we have either by signes or effects. So much by this comparison doth *Astrologie* appear worthy to be preferred before *Physick*. Every well remember what *Hieronimus Cardanus* an excellent Physitian in his Comment upon *Ptolomyes* *Quaestio*. saith. If by the Art of *Astrologie* he had not better attained to the knowledge of his disease, then the Physitian that would have administered unto him could do by his skill; he had assuredly been cured by death, rather then preserved alive by *Physick*. I have been the larger in this particular, in regard I have known and experimented many excellent *Astrological* observations far transcending all other helps in *Physick*; It is necessary the Physitian should be skillfull in *Astrologie*. But contrarywise, *Ex quo est illud Rhodanum sit Mercurius*, Every *Astrologer* cannot be a Physitian. Now the Nativitie being known precisely, Or if but *Tempus Ob-*

accident good or bad) be observed, that thereby the Necessity may be rectified, And then no question, but as many accidents may be foreseen; so many evils may be prevented, and those things we call good, adjuvanted by a prudent man.

Cogere sed nequeunt Animum ratione fruentem:

Quippe sub imperio solius ipse Dei est:

Sed quia terrestri mens aurea mule gravatur:

Sub Iuga sepe sui Corporis acta Venit.

And indeed many times when the best of us seek to avoid perils and dangers by a certaine kind of necessity we run headlong into them, *Quicquid patimur mortales quicquid facimus.* Venit ab Alto, Regitur satis mortale Genus, *Tapes Scheca,* Mulki ad Fatum venera sum dum fata timent. Now if any so obstinate as will deny the influence of the Superior bodies over us, and inveigh against that they understand not, let him make experience of it himselfe if he be able, or trust one that can with his Sentence, and he shall confesse his error, and acknowledge the wonderfull power of God in the government of the world, by the Celestiall Bodies, I know that many superstitious and grosse abuses are practised by the ignorant under colour of this most excellent Art, but this must not be charged on the Art, but the Artist. By how much any science or learning is more excellent or sublimed, by so much the more easily is it abused, *Quid Theologia constantius? Quid divinius?* And yet in all ages and all parts of the world there hath sprung up new Sects and nobell opinions in Religion full of superstition, abuses and Heresies. Is it not so at this day? Is it not so in Law, Physick, and other liberall and free Studies? *Nulla harum est Arcium quin suis mendis & abusibus sit referta.* One thing there is which our adversaries plead against the Art, And say that Astrology is unprofitable, and the good or evil foretold by the Artist is not necessary to be known. It is true, if there were such an absolute necessity in the Influences of the Stars, that we could in some sort change or correct them, And therefore it is not only not unprofitable, but very expedient to foreknow the effects of the Heavenly bodies, That so if they be Good, we might not be Elevated with an unexpected felicity, And if evil, that then we might fore-arme our selves and be ware of them; For *prævisa minus Lædunt,* The Author of the

Of the Spring.

The Spring takes beginning this year upon Sunday the
 tenth day of March, 10 minutes past 3 a clock in the
 morning, at which time the Sun enters the first minute of
 Aries, under such a position as followeth at London.

Having diligently collected the testimonies of the
 Nates, I found Mars to have 36 dignities and 14 29. The
 sun without all controversies are chief Moderators of the
 Spring quarter: Mars he is exalted in the Ascendant; but
 unhappily placed in the 6. House in his fall: He is likewise
 Lord of the mid-heaven or 10. House, which is opposed by
 Jupiter. And Jupiter the other Significator is near the 7. House
 in the North Angle. From which severall positions, we may
 thus gather: Mars in the 6th House in Cancer, Threatens
 many diseases proceeding from corrupt blood and choller: It
 doubt his position threatens a Plague, or some raging
 venereal disease God prevent it, certainly the Dragons-tail
 in the Popascope, Significat detrimentum hominum, & pericula
 Tribulationes: Besides Mars in Cancer Signifies sudden
 Wracks, warres, Riots and contention to happen in the
 parts. And because he hath North Latitude, and is Decent
 ball of the Sun, Gravitate frigoris in tempore suo, & paucitate
 Aquarum fontium significat, & Curam aquae sollicitudinem Vul-

Mars is in the 9. from the 10. A certain prince or great person
shall endeavour to go a voyage by Sea to the North or North
West: But it will be impedit by proper Calamities: Haly saith,
That when the Lord of the year (or Revolution) shall be op-
posite to the Ascendent of the Revolution of the year, he is an
Enemy of the year: This year it is so; for Mars is Lord of
the Revolution, & of the Ascendent by exaltation, and is now
opposite to it, and unfortunate in his fall. Unde erit Annus ille
fortis & malus ac multarum diminutionum, Laborum & occasionum,
et est deterior quam Infortunia Infortuniorum, & talis existens ma-
gis mali significat quam Infortunia. The Trine of Mercurie and
Venus to Mars will much abate of the evill; But the hatefull
square of Mars to the Sunne from Cardinali signes, significat
damnum Civis & altis hominibus: presently after the Sunnes In-
gressus into Aries, there is a Quartile of him to the Moone, and
unlesse the Sextile of Venus intercept, the D applies to the
opposition of Mars, which threatens strife, debate quarrellings
and much bloodshed; De Deushis finem. As for Iupiter in the
4. House in Taurus near the 7. Stars, Culturam Agrorum for-
mar, ex quibus magnum Proventum spondet. Iupiter is the best of
all the Planets that makes an Exit out of the Signe he is in:
And as Haly sayes, he is Lord of the year, and so much the rat-
her, because he is nearest an Angle; But for that he is en-
tering on the 25. of March into his Decrement, I meane,
I where he is Debilis et tristitiam et diminutionem minatur,
Cogitationesq; Regum ad divinationes, Incantationes, et munien-
das Civitates et Castra et incipienda bella occulte dirigentur. The
D; gone taile in Aquarius in the ascendant doth signifie as
Suido Bonatus saith, Inquisitionem Regis contra dominos heredi-
tarium in hoc quod non debent et seductionem eorum in censu, et
iniurias atque afflictiones quas exercebit contra eos, cum captione
eorum ac flagellatione. The D in the 12 hastening to an opo-
sition of Mars doth signifie many impediments, instability of
the times, much cruelty, et rixas, carceres, contentionem, et de-
dalla multa ex parte Inimicorum, During this Quarter (viz.)
from the 10 of March to the 11 of June there happen these no-
table Configurations of the planets amongst themselves as
followeth.

Having exactly observed the Celestiall Scheme at the Sunes entrance into Cancer together with the full Moon Pre-ventionall, and new Moon Post-ventionall, and summing up the dignities of the Significators, I finde the Luminaries to be chiefe Disposers of this Summer Quarter, and hold the Benevolents to be their Coadiutors, viz. the ♀ to have 26. Fortitudes without any debilities. The Sun 25. ♀ 21. and ♀ 21. and the other three Planets, viz. malicious ♀ and angry ♀ and unconstant ♀ to have little to doe therein; I

good to happen to mankind: For as the Sun. In the Planeta-
 rum Regis mediam in Caelo sedem occupans vniversalis mundi spi-
 ritu totam naturam vegetat, recreat, conseruat: So the Moone is
 Solis Coniunx & Stellarum Regina: She is the Earths Planet,
 and conueighs the Influence of the Planets and Stars im-
 mediately thereon: So likewise those dismal effects, which
 usually proceed from the Malignitie of Saturne, are expelled
 by Iupiter, and those qualles which are raised by Mars, are al-
 layed by Venus. But let us see what their severall positions
 doth demonstrare. I finde the ♄ having lately left the body
 of ♀, and separating from the hatefull square of Mars, is in
 conjunction with the seven Stars in her exaltation, And the
 next day after the accompanie ♄, where she findes ♄ gone
 from him leaving him in ♀ his detriment. All the foure
 Significators are in the 11. House, Vnde Fortunam passim af-
 fluentem denotant. For Iupiter signifies safety and security, The
 Sun quietnesse, peace and much good, the like do Venus and the
 Moone: But I fear the those places under Taurus thoro which
 Saturne do make his Progresse, and those under Aries where
 Mars now is near the Royall Star, Cor Leonis shall suffer much,
 per Grandes Interfectiones & lites magnas: For as Russia, Polonia,
 Swethland, Ireland, &c. together with some Cities, as Bononia,
 Sena, Mantua, &c. are under Taurus: So under Leo are Gallia,
 Togara, the Alps, Italy, Bohemia, Turkey, Rome, Ravenna, Prague,
 &c. I say no more, The other places you may read many last
 years Almanack. If Saturne in the 10. House doe threaten
 Merorem, tristitia attritiones et Gravitates ex parte Regis, sed per-
 plexitates Carceris, And mars upon the culpe of the second house,
 Copiam latronum et praedonum, qui furta rapinas, et depopulatio-
 nes exercebunt, et quod vivent homines miseram vitam ob pres-
 suram, et impositionem tributorum. And Mercury retrograde in
 the 12. dissidia, rixas, et hostilia, odia imprimis Conseruorum, I shall
 willingly assent to Guido Bonatus and Haly: For I have often
 found their obseruations agreeable to truth: And I doubt
 not much of their verification this yeare, the state of things
 considered. There are some notable Aspects happening this
 quarter, which I will set down good and bad as they fall due.

Of Autumne.

Autumne or Harbest happens when the Sonne equals the day and night the second time, and this year is on Friday the 12. of Septem. 5. min. past 9. of the clock in the night, at which time as the Sun enters Libra, thus is the face of heaven.

Thus you see how the 7 planets are disposed, And amongst them Mercury is chiefe ruler for he hath in the 3 figures viz. the New Moon preceding the ingresse. The ingresse it selfe, and the full Moon succeeding 30 dignities, Saturne challenges a halfe part for he hath 16. To whom we may ioyne. The Moon and Mars who have 10. a piece; But Iupiter the Sun and Venus are much debilitated, for have but little power this quarter. amendment: For as in the middle of June that year as there
 is a fearful Coniunction of Saturne and Mars in the middle of
 Taurus. So at the end of that month there is a happy meeting
 of Sol and ♃ in his Exaltation: But to returne to the present
 Figure. We see here as Mars and Venus are in exact Coniun-
 ction near the Aegleis Spike, nor three minutes asunder in
 respect of Longitude, yet Venus is above 3 one degree 10 mi-
 nutes in respect of Latitude, And Saturne is exactly opposite
 to the Moone, who is in her fall in Scorpio: The Dragon's Tayle
 is in medio Caeli, then which nothing can be worse, for if we
 may beleve Guido Bonatus, He tells sol. 395. cap. 107. Quod
 significat impedimentum Regum atque Nobilium, seu insignatum &
 diminutionem honoris eorum seu dignitatum, *Albunus* dicit, quod
 significat depositionem & pericula, & peregrinationem sive Exilium:
 The Coniunction of Mars and Venus in the 5. House doth sig-
 nifie multa fornicationes, & laborabunt pregnantes, & accident
 damna & labores. Unless the presence of Mercury do mitigate:
 Besides the late Coniunction of Mars and Mercury, which doth
 shew, that multi homines falsabunt moneta, metus ac labores ac-
 cident hominibus, & vilipendentur sapientes, & eriscent multi Vasa
 & deceptores. And this is threatened the more by the Appli-
 cation of ♄ to the opposition of ♃ who now doth oppose the ♀
 which rasseth in any falsities, lies, scandals, Et quod falsabuntur
 seu corruptentur libri: Et quod homines habebunt placia, et tristi-
 tias, et labores, ex dicta ratione. The ☐ of the Sun and Iupiter in
 cardinal signes saves, Justice shall be executed on some great
 person, and many suits in Law shall be as Δ ♃ ♀ doth de-
 monstrate. But I fear much the hateful opposition of ♃ and
 ♄ this in M, the order in ☿: This doth cause scanda, deceits,
 quarrellings and debates, Et significat quod homines in se invi-
 cem discordabunt et prosequuntur se mutuo odio, et cessabunt se fa-
 miliariter invicere, et detrahebunt quilibet alteri, Mars tyranneth Ire-
 land for many other places in the X. and not without cause, for
 ♃ who is dominus Medij Coeli (where the Dragons taylets,) is
 now in the 12. in opposition, exactly to the ♀ who being
 in M hath ♄ for her disposer, a few dayes will make these
 things apparent; but most especially about the middle of June
 1646. For the 12. day Saturne and Mars meet in Coniunction
 in the middle of Taurus, and the next day the ♀ is in Opposi-
 tion to them. This cannot passe without great perill, so
 to no meane person: Qui potest Capere, Capiat: But of this
 enough. Now I will note unto you such dayes as the planets
 in this Quarter have good or evill aspects one to another

Of Winter.

Winter begins at such time as the Sun entreteth into the first scruple of Capricorne, which with us at London is on Thursday the 11. of Decembar, 41. minutes past 8. a clock in the Morning, inst halfe an houre after his rising, at which time the Heavens are thus disposed, as followeth,

Ascendant	6 49 ♀
☾ Moone	4 50 ☿
♀ Venus	10 9 ☿
♄ Drag. tail	10 31 ☿
♃ House	23 2 ☿

11 House	29 24 ☿

Mars hath most dignities in this quarter for he hath 37. next unto him is ♀ for he hath 26. Then the Sun hath 11. And ♀ hath 8. Venus and Mercury and the ♀ are weak & debilitated. At this time the Sun is in opposition to Jupiter & the 19. day Mars likewise opposeth ♀ which cannot passe without notable occurrences: Haly saith Si Applicatio Solis & Iovis fuerit de opposi-

According to the Rule that Ptolemy gives, he says, that the
 Eclipse continue a year and 3. months, because the duration
 is one hour, 54. minutes, and because the Sun at the middle
 of the Eclipse is distant from the Ascendant or Vozolscop
 two signs seven degrees, it should be the 29. of January 1650.
 before they will begin and end the 26. of December 1651.

 But must not exceed my bounds: My loving friend Master Wil
